

Pagination

Pagination is supported for the Entities API, Positions API, Users API, Groups API, Files API, and Archived Files API so that large result sets can be batched into multiple responses.

The maximum page size of 500 results is enforced per response. If the complete results cannot fit into a single response, the set will be truncated automatically, and the remaining values linked from the "next" URL appended to the end of the set.

Query Parameters:

PARAMETER	DESCRIPTION	EXAMPLE
<code>page[limit]</code>	The number of results to be returned. The maximum result set size is 500.	<code>100</code>
<code>page[after]</code>	The next page; the returned paginated data must have as its first item the item that is immediately after the cursor in the results list.	<code>10001</code>

Links:

NAME	DESCRIPTION	EXAMPLE
<code>"next"</code>	The URL of the "next" page of the result set. Null if there are no additional pages.	<code>"/v1/entities?<code>page[limit]=100&page[after]=10001"</code>

Example:

REQUEST	RESPONSE
<code>GET /v1/entities?page[limit]=100</code>
